

Testimonial

I am very happy and privileged to serve as an evaluator. Previously I have volunteered as an evaluator for GYS Avishkar Awards 2025 and was very much impressed that so many students have participated along with satisfactory content.

As a person with mechanical and process engineering background I am very passionate about hands on learning and seeing these students' creativity was incredibly inspiring. I feel that this inspiration is not only for me but also for fellow competitors and evaluators.

This generation mostly focuses on logical thinking. This program made better impact on students' scientific thinking as well. Certain approaches that are still in processes were also exposed by students which brought a lot of awareness to fellow viewers and listeners.

Reviewing these innovative projects was a highly rewarding experience. The time spent by the young generation on these projects and simplifying them and showing it to viewers makes the program remarkable. Programs like this are very essential for building confidence and to demonstrate their ideas and also learn more.

Such competitions will bridge the gap between academic and real-world applications. I commend this program for creating a unique ecosystem for teachers, students and learners where everyone can thrive to share technical knowledge.

It is a good encouragement for both teachers and students. I am very happy to actively participate and be a member in this most wonderful platform.
